Tree Survey Map

Introduction and Overview

David J. Powers & Assoc., while coordinating an Environmental Impact Statement, has contracted with Concentric Ecologies to develop a Tree Report for review by the City of San Jose, California. The site will be referred to as:

Harvest / San Tomas Business Park Project

The physical addresses being:

San Tomas Business Park on the corner of San Tomas Expressway and Walsh Avenue and 2400 Condensa Street in the city of Santa Clara , CA.

The report includes the following information:

- An evaluation of the health of the trees from a ground level, visual inspection.
- An evaluation of the impacts of the proposed development on the trees.
- Overhead maps showing tree locations.

The inspection was done at ground level and no biological tests were preformed.

Methods

The inventory includes the diameter at two feet above grade, the height, overall health/vigor, and the potential hazards the trees may pose to structures and pedestrians. The inspection includes all tree measuring 6 inches in diameter and greater. The inspection was done visually and no biological tests were performed. The survey followed the following steps:

1. Tree Identification, as per species and variety, where able.
2. Measuring the diameter of each tree at 24 inches above grade.
3. Evaluating the overall health of each individual tree using a 1 through 5 rating system whereas;

1. = Poor Health
2. = Fair Health
3. = Average
4. = Good Health
5. = Excellent Health

4. Rated the suitability for preservation whereas:

Good = Trees with good or excellent health and good or excellent structure and have a reasonable chance to survive construction.

Moderate = Trees that have a average or fair health and average or fair structure and, with adequate care, may survive the construction.

Poor = Trees that, either because of poor health or poor structure, are not good candidates for survival. This category may include species that are unsuitable for landscapes.

Tree preservation considers several different factors.

- Overall tree health is the main consideration when ascertaining a trees chance of surviving the ordeal of surviving in a construction zone.
- Species life span or longevity – if a tree is near the end of its useful life it may not be a good candidate for preservation.
- Structure – Often overlooked, improper structure can limit a trees lifespan and therefore lower the trees overall suitability for preservation.
- Individual tree responses – Some trees are more tolerant of disturbance; while others are not.

TYPES OF CONSTRUCTION DAMAGE

Tree decline and mortality, around newly constructed homes, is a result primarily from damage to the root system. During construction, roots are frequently cut when installing foundations, water and sewer lines or other utilities, driveways, curbs, sidewalks, etc.

Many roots are also lost when soil is removed during grading. Feeder roots occur primarily within the top six to eight inches of soil, and removing just a few inches of soil during grading can result in the elimination of much of these roots. Loss of feeder roots will reduce the water and nutrient absorption capability, which can eventually lead to decline. Cutting large roots increases the possibility of windthrow during severe storms and may lead to future hazardous decay. Compaction of the soil or placing fill over a tree root system during grading is equally as destructive as cutting and removing roots. All plant cells, including those in the roots, require oxygen to survive. Root cells obtain oxygen from pores within the soil. When the soil over the root system of a tree is compacted or fill is added during grading, the amount of soil air is greatly reduced. At the same time, gases toxic to plant roots tend to accumulate in the soil. These adverse factors result in root mortality and tree decline. Mechanical injuries to the stem and limbs also contribute to tree decline. Bark injuries inhibit transport of water and nutrients to the crown and allow entrance of decay and other disease organisms.

PREVENTING CONSTRUCTION DAMAGE

Root Damage - Reducing root damage is the key to preventing tree decline and death after building construction. Physical barriers such as fencing should be erected around trees to prevent encroachment by construction equipment. This will minimize soil compaction and also prevent fill and other debris from being placed over the root system. Barriers preferably should be placed at least midway between the bole of the tree and the drip line. If construction equipment must pass close to the tree, a bridge can be constructed over the root system. This is done by placing a steel plate over railroad ties, which are placed at intervals along the ground as supports.

Grade Changes - Grade changes around trees should be avoided whenever possible. If fill must be placed over the root system of a tree, construction of a tree well will help minimize the impact of the fill. If the grade must be cut, this should be done outside the tree's root system. Methods for cutting the grade near trees are described in the aforementioned technical report.

Pruning - Prior to the initiation of construction, interfering lower limbs on trees to be saved should be pruned to allow access for construction equipment. Large deadwood also should be removed at this time in order to eliminate a possible safety hazard to construction workers. Trees remaining on the building lot may be pruned to compensate for damage to the root system that inevitably occurs during construction, if they are excessively damaged. The objective is to reduce the size of the crown to a level that the root system can support. If removing live limbs choose sucker growth, competing and

conflicting limbs and low, interfering branches. Lightly cutting back side branches may be necessary to further "lighten" the crown if root disturbance was severe.

The crown should not be cut back harshly (topped).

Corrective pruning can be undertaken either before construction begins or immediately following completion.

Removing more than 15% of foliage may be detrimental.

Description of Trees

The inspection was conducted in December 2007. 736 trees were inspected. The survey includes all trees measuring at least 3 inches in diameter and greater measured at 4 1/2 feet above grade, also included are any trees that are over 6 feet in height regardless of diameter. The survey was done from ground level and no biological tests were performed.

Photographs were taken of any tree equal to or greater than 18 inches in diameter, measured 4 1/2 feet from grade.

The most numerous tree on the property is the Ash (*fraxinus x*). There are 181 Ash Trees 153 of which are in average health. Many of the trees display poor structure due to improper pruning practices. Improper pruning often results in Co-dominant stems. Several of the Ash trees have been topped. For the most part these trees are healthy with no signs of insect infestation or disease.

There are 95 Purple Leafed Plums (*prunus atropurpurea*). Only 12 of these trees are classified as Average Health, 81 of the Purple Leaf Plums are in Fair Health (below average) and many of those display patches of gum. This symptom is often referred to as gumosis which can result from attack by insects, microorganisms, or adverse weather conditions. The larger Purple Leaf Plums are reaching maturity and have started to decline.

75 Sweet Gum (*liquidambar*) trees were inventoried with an average diameter of almost 6 1/2 inches. Only 39 of which are in average health. Most of the Sweet gum trees are on the smaller side. Many Sweet gums display com-dominant stems, this is noted in the inventory.

73 Crepe Myrtles (*Lagerstroemia*) averaging 4 1/3 inches, these trees are newly planted and have not yet reached maturity. 38 are in average health while 35 are in fair health.

70 Sycamore tree (*Platanus x*) most of the Sycamores are planted along the borders of the property. Several of these trees are marked for removal to accommodate a new pathway along the San Tomas Expressway and Walsh Avenue.

54 Pine trees are planted along the San Tomas Expressway, Central Expressway and Walsh Avenue, these pine trees show signs of infestation by Pitch Moths. Several of these pines require cabling which will provide mechanical support to the weakly attached limbs.

31 Redwood trees are included in this inventory. 30 of 31 Redwoods are in average health. The 30 Redwoods in average health are good candidates for preservation. The follow steps should be taken to preserve these trees and insure that they survive the construction phase and continue to thrive:

- Set adequate protection areas to protect root zones.
- Provided adequate irrigation is (1 inch of irrigation per month per inch of diameter).
- Nutrients injected into the soil and available for root elongation and the spring flush of growth.
- Increase planting area to provide a more natural organic zone for the tree to absorb moisture.
- Allow leafy material to build up around the trees. (No blowing or raking).

The remainder of the trees are listed in the inventory reports below.

Count by Species

Printed Date: 12/9/2007

Last modified: 12/1/2007

Report Description:

Alder	Alnus	x	2
Ash	Fraxinus	x	181
Birch	Betula	pendula	2
